ABSTRACT

The focus of this post-hoc descriptive study is to present comparative data pertaining to the differences, if any, in defined outcomes among full-time Extended Opportunities Programs and Services (EOPS) and the total cohort of full-time students in the California Community Colleges Student-Right-To-Know (SRTK) database for 1994-95 and 1995-96. The data for both years show that females comprised a statistically significant greater proportion of the EOPS population. Similarly, the EOPS population showed a significantly greater proportion of minority students. EOPS students significantly exceeded the population statistics for attainment of degrees and/or certificates. There were distinctive patterns of attainment among sub-groups pertaining to awards. The 1994-95 EOPS students attained a slightly higher proportion of AA and AS degrees during the follow-up period than the total population, while in the 1995-96 population, EOPS students attained a slightly higher percentage of certificates. In both years, the total population showed about 1% higher proportions of transfer preparedness than did the EOPS population. Among the 1994-95 population, non-EOPS students showed a 5.73% higher rate of overall transfer than did the total cohort. The difference in the following year's population was 7.43% in favor of the non-EOPS population. In each case, the critical pattern was found to be in transfer to four-year colleges and universities. Faculty - Researcher Emeritus
Mendocino College

Background:

The Management Information Services staff of the California Community Colleges has over the last several years developed a statewide reporting data base to comply with the federal Student-Right-To-Know (SRTK) requirements for post-secondary institutions. By definition, the SRTK cohort includes students who are:

- Enrolled for the First-time in a post-secondary institution;
- Enrolled Full or Part-time in degree-applicable courses;
- Certificate or degree-seeking by self-declaration

In addition, the Cohort also includes Federal Financial Aid recipients, who meet the first two criteria but have not stated a declared certificate or degree goal. In developing the draft cohort, Patrick Perry of the Chancellor's Office, California Community Colleges worked with a statewide advisory panel to assure a common and compliant set of standards for data retrieval, storage and management. An initial draft of the database indicated that approximately 113,600 students in the California Community Colleges, or 27.46% of the total credit enrollment (N=413,747) met the criteria. The draft database was comprised of 52,046 (12.58%) Full-time and 61,579 (14.88%) Part-time students. Under the federal requirements, institutions have been required since the 1994-95 academic year to track the success of students in the SRTK Cohort as measured by degree or certificate attainment, attaining 'transfer prepared' status (56 transferable units with at least a 2.0 gpa), or transfer to another institution to continue progress toward the declared goal. Institutions are required to track the SRTK Cohort for a total of 6 years, reporting progress at three-year intervals. To date, three cohorts have been tracked for the first three years, beginning with the 1994 data.

EOPS - 2

Included in the data fields for the MIS database pertaining to SRTK was an indicator to identify which students were enrolled in the Extended Opportunities Programs and Services (EOPS) in the defining term of enrollment.

The EOPS program was established under legislation sponsored by California State Senator Albert Alquist in 1969 in order to enhance student success, equity, access, retention, and persistence toward goal completion among students whose educational and socio-economic backgrounds might prevent them from attending or succeeding in post-secondary education.

Research Questions and Design of the Present Study

The focus of this post-hoc descriptive study is to present comparative and contrastive data pertaining to the differences, if any, in defined outcomes among full-time EOPS and the Total cohort of Full-time students in the SRTK data base. For purposes of the study, the following questions were framed:

1. How do the EOPS students in the cohort compare to the Total cohort in Race-Ethnicity and Gender?
2. How do the EOPS students in the cohort compare to the Total cohort in the attainment of degrees or certificates at the end of the initial three-year follow-up period?
3. How do the EOPS students in the cohort compare to the Total cohort in Transfer Preparedness at the end of the initial three-year follow-up period?
4. How do the EOPS student in the cohort compare to the Total cohort in Transfer patterns at the end of the initial three-year follow-up period?
5. What differences in Race-Ethnicity and/or Gender are associated with differential outcomes?

Access to statewide California Community College data from the 1994-95 and 1995-96 Cohorts was graciously provided by Patrick Perry and the MIS Staff. The Analysis of the data focused upon Full-time students in order to limit the focus of the study to those students who would be likeliest to attain a successful outcome over three years, and in order to provide preliminary answers to the research questions as the basis for further study as resources may become available to support a more comprehensive design. The population was selected using BRIO Enterprise software to select students with an EOPS identifier (Y/N), who were enrolled in at least 12 degree-applicable units of credit, as defined by SRTK criteria. To identify membership in the defined target population, BRIO Query files were left-linked according to student identification number, thus attempting to assure that defined outcome measures would be linked with individual student achievement in the population. Student success measures included degree type (AA, AS, Certificate), Student Transfer Preparedness (STP), and Student Transfer. It should be noted that the definition of the target population within the statewide database carries the burden of potential bias for several reasons. First, as noted elsewhere, the numbers of students defined by the parameters utilized is extremely small in comparison with the total statewide enrollments of community college students in California, whether EOPS or Non-Eops. Second, the selection criteria based on SRTK definitions include in the definition of 12 only degree-applicable college level course credit values, thus eliminating from the study those students who are enrolled in a high proportion of basic skills credits. Finally, it should be noted that participation in the EOPS programs of the various campuses statewide is voluntarily chosen, and there is no objective way to control for the motivational differences, if any, among those who so choose versus those who do not. In essence, the defined population is the "likeliest to succeed" in many respects, and it should therefore give pause to any tendency to reach beyond the findings to greater generalizations than are warranted by the data.

Findings presented in this study are discrete as to the several possible attainments of success, as contrasted with the SRTK analysis, which concatenates all success measures into a single statistic. Simple comparisons of proportions were developed to assess the difference between the EOPS population and the total population (including EOPS) for each of the outcome measures. In each case, the null hypothesis would be that Full-time EOPS students showed no statistically significant differences in attainment, as compared with the total Full-time STRK Cohort. Given the nature of the EOPS population, the attainment of comparable measures of success to others with ostensibly fewer educational or socio-economic challenges to educational attainment would be sufficient to show the efficacy of EOPS in attaining at least some of its programmatic goals.

Analysis of the data was based on comparisons of the *within-population* proportions of EOPS student attaining the selected outcomes with the *total population* proportions. Tabular data include detail for each discrete group within the population (EOPS vs. Non-EOPS), for the benefit of those who may wish to conduct

EOPS - 4

further secondary analysis of the findings. A disadvantage of the method of analysis is that the large size of the population virtually assures that very minimal differences will turn out to be statistically significant, due to the method of calculating the standard deviation (binomial). A number of alternative approaches might have been considered, and are recommended to those who may continue the work begun in this preliminary report. One such method might be the construction of 2X2 or extended Chi-Square tables, treating the "EOPS" and "Non-EOPS" groups as discrete populations rather than viewing the EOPS as a sub-population within the total. Another approach, suggested by Willard Hom, Interim Director of the Research and Analysis Unit, California Community Colleges, might be to have used odds ratios, which would have the additional advantage of presenting more easily compared relationships across the series of tables. Cell residuals could be analyzed in greater detail in cross-tabular data to provide clues for further research, especially as it pertains to the differential attainments across gender or racial lines.

In this connection, it should be noted that the findings and conclusions presented in this preliminary and descriptive study should in no way be interpreted as indicating either the success or the magnitude of the impact of the EOPS program in the California Community Colleges, nor of the success of the Community Colleges in attaining their overall mission for all students. As noted above, the benchmark data for the CCCs showed that the Full-time SRTK Cohort accounted for only 12.58% of the total credit enrollment. On the EOPS side, the 1994-95 population selected for this study (N=3270) accounted for only 4.08% of all EOPS students served that academic year (N=80,090); for 1995-96 population accounted for 3.94% (3095 out of 78,511).

Findings:

Tabular data are presented in a series of four main tables for each academic year, with sub-analyses provided in the appendices for each outcome measure. Synopses for each of the two academic years are also provided, showing areas of particular emphasis for possible future research. As noted above, the method used was to compare the EOPS statistics with the Total population statistics of which they were a part.

Racial-Ethnic and Gender Comparison:

Tables 1 and 2 show the Racial-Ethnic and Gender comparison among students for the two academic years included in the study. The legislative intent of SB164, which created EOPS, was to "encourage local community colleges to establish and develop programs directed to identifying those students affected by language, social and economic handicaps." A special focus on many campuses has been the EOPS effort to attract and retain re-entry female students who have the maturity, incentive and capability of pursuing their educational goals. The data for both years shows that Females comprised a statistically significant greater proportion of the EOPS population. Similarly, the EOPS population showed a significantly greater proportion of Minority students, considered as a collective category. The only sub-group that was under-represented among EOPS was Filipino/ Pacific Islander. Insofar as EOPS intends to attract historically under-represented students to the California Community College, these data suggest that the program is working effectively as shown by the greater presence of Female and Minority students in the Full-time SRTK Cohort.

Outcome Measures:

Degrees and Certificates

Tables 3 and 4 show the aggregate patterns of the 1994-95 and 1995-96 Full-time SRTK Cohort for EOPS vs. the Total population of students in the California Community Colleges. Data include degrees and certificates awarded during the six-semester follow-up period. For both cohort years, EOPS students significantly exceeded the population statistics for attainment of degrees and/ or certificates. In calculating these data, the highest level of attainment was recorded, and only one award was recorded per student where appropriate. The fact that some students may have attained more than one outcome goal is not reflected in the analysis. Specific data show:

| | 1994-95 | Awards | Total | % | 1995-96 | Awards | Total | % |
|--------------------|---------|------------|------------|--------------------|---------|-----------|------------|---|
| EOPS | 663 | 3270 | 20.28% | EOPS | 598 | 3095 | 19.32% | |
| Total | 6536 | 38057 | 17.147% | Total | 6684 | 38021 | 17.58% | |
| Difference: | 3.10% | Z = 16.039 | p. < .0001 | Difference: | 1.74% | Z = 8.922 | p. < .0001 | |

There were distinctive patterns of attainment among sub-groups pertaining to awards. For example, 1994-95 Asian EOPS students outperformed the population by 8.49%. Sub-analyses showed that the differences among EOPS vs. Population among both Male and Female Asian students in 1994-95 were statistically significant at $p < .0001$. In the 1994 cohort, EOPS Hispanic Females attained 6.69% more Awards than the Total Hispanic Female Population.

Tables 5 and 6 show the specific types of Awards for the total populations of the two academic years included in the study. The data indicate that the 1994-95 EOPS students attained a slightly higher proportion of AA,AS degrees during the follow-up period than the Total population (14.92% vs. 14.35%), while in the 1995-96 population EOPS students attained a slightly higher percentage of Certificates (1.39% vs. 1.05%). Each of these differences is statistically significant at $p < .0001$. While statistical significance is an important consideration in every comparison, the larger picture is also to be noted. Specific attainment by EOPS students over the two academic years investigated shows that in spite of the kinds of educational or socio-economic challenges they may have faced upon entry, they were able to achieve degrees and certificates at a rate comparable to the total population. Affirmatively stated, the EOPS programs and services in the California Community Colleges provided a framework for equal attainment among historically high-risk students.

Student Transfer Preparedness (STP):

Table 7 and 8 show Transfer Preparedness for the populations of 1994-95 and 1995-95. The data indicate that in both years the Total Population showed about 1% higher proportions of Transfer Preparedness than did the EOPS population. These contrasts were statistically significant in each case at $p < .0001$. Sub-analyses, however, showed that 1994-95 Asian EOPS students enjoyed a 5.63% advantage over the Total Asian population ($Z=8.432$; $p < .0001$); the 1995-96 difference was 8.62% in favor of the EOPS.

Several contrasts were developed comparing EOPS and Non-EOPS students. In these comparisons, it was found that Filipino/Pacific Islander EOPS students exceeded their Non-EOPS peers by 11.20% in 1995 ($Z=10.72$; $p < .0001$). At the other extreme, there was a -9.42% difference between EOPS and Non-EOPS White, Non-Hispanic students in the 1994-95 Population ($Z=-27.80$; $p < .0001$). In the subsequent year, the difference was -6.96%. Sub-analyses of the data for both years show that the highest negative comparisons occurred among White, Non-Hispanic Females.

Student Transfer:

Tables 9 and 10 show actual patterns of transfer for the populations of 1994-95 and 1995-96. Among the 1994-95 population, Non-EOPS students showed a 5.73% higher rate of overall transfer than did the Total cohort ($Z = -22.688$; $p < .0001$). The difference in the following year's population was 7.43% in favor of the Non-EOPS population. In each case, the critical pattern was found to be in transfer to four-year colleges and universities. Once again, there were differences among the Racial-Ethnic sub-populations: in the 1995-96 cohort, Asian EOPS out-transferred the Total Asian peer group by 2.58%. However, White, Non-Hispanic EOPS students lagged behind the Total cohort of their peer students by 18.15% in the 1994-95 class; by 15.97% in the subsequent class.

The Transfer data suggest that White, Non-Hispanic EOPS students do not accrue a significant advantage in Transfer status as a result of their participation in the program, and that this is especially true for the four-year college or university transfer level.

Concluding Observations:

The data presented in this study show that, for the very limited populations of First-Time, Full-time, Goal-Directed EOPS students enrolled in degree-applicable courses during the 1994-95 and 1995-96 academic years in California Community Colleges, and followed-up for three years:

- EOPS programs and services have had a significant impact on the Racial-Ethnic and Gender diversity of the California Community Colleges.
- EOPS students, as compared with the total population, attained a statistically significantly greater percentage of degrees and certificates attained. (Degrees for the 1994-95 cohort; Certificates for the 1995-96 cohort).
- Asians of both Genders and Hispanic Female EOPS students showed a pattern of AA/AS degree attainment that was significantly higher than the populations of each group.

- In the aggregate, EOPS students did not attain Student Transfer Prepared status in comparable proportions to the populations of either academic year included in the study. However, Asian and Filipino/Pacific Island students exceeded their peers in both cases.
- Only the Asian EOPS students out-did the population in actually transferring during the three-year follow-up period. White, Non-Hispanic students did not seem to accrue any advantage over the population in terms of transfer.

An unstated purpose of this investigation is to stimulate and encourage further investigation of the patterns of persistence and performance over time for EOPS students in the California Community Colleges. Researchers should be aware of the enormously useful data base represented by the work of the Chancellor's Office MIS Staff assigned to SRTK follow-up. Local researchers may easily access the data base for their own districts. Larger scale investigations may be conducted, with many more sub-analyses than have been attempted in this very preliminary and descriptive investigation. In this regard, the good offices of the Research and Planning Group of the California Community Colleges may be an appropriate vehicle for conducting future research, provided that adequate funding and support can be made available.

Special Acknowledgements:

Deepest appreciation to Patrick Perry and Tim Brown of the Chancellor's Office who provided access to the data base, and technical support through the data collection phase of the Project. Without their assistance, this research would not have been at all possible. The thoughtful comments of Willard Horn contributed to the clarity of this report; the author takes full responsibility for its limitations.

Deepest appreciation to the Research and Planning Group, California Community Colleges, for encouraging and support the efforts of the individual colleges and districts to maintain and improve the highest professional standards of excellence in the critical support areas of Research and Planning. Personal thanks to the RP Group for the encouragement I have received during all phases of my 39 years of service to the California Community Colleges, as Faculty Member, Researcher and Administrator.
